Kunjin virus

Kunjin virus

Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;

Viruses; ssRNA positive-strand virus group.

1 (bases 1 to 633)

Scherret, J. H., Poidinger, M., Mackenzie, J.S., Broom, A.K., Deubel, V.,

Lipkin, W.I., Briese, T., Gould, E.A. and Hall, R.A.

The relationships between West Nile and Kunjin viruses

Emerging Infect. Dis. 7 (4), 697-705 (2001)

New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                         invention may allow for accurate and efficient high throughput screening. The present sequence is that of a PCR primer which is related to the
                                                                                                                                                                                    This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like west Nile virus, that may be present in a biological sample. West Nile virus in the may be present in a biological sample. West Nile virus with humans and horses serving as incidental hosts. Infection of humans can lead to maningitis or encephalitis. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New hybridization assay probe comprising target-complementary sequence bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        hybridisation assay probe; nucleic acid detection; target-complementary sequence; flavivirus; West Nile virus; WNV; RNA virus; infection; meningitis; encephalitis; high throughput screening; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        West Nile virus detection-related oligonucleotide probe SeqID66.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 18; DB 12; Length 18; 100.0%; Pred.                                                                                                                                                                                                                                     invention may allow for accurate and efficient high throughput screening.
The present sequence is that of an oligonucleotide probe which is related
                               This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (MNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The

birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a trarget-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus, that may be present in a biological sample. West nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningities or encoephalitis. The invention may allow for accurate and efficient high throughput screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (MNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonuclectide probe which is related to the invention.

Analyzing a target nucleic acid sequence in a biological material by real time PCR using nucleic acid primers that are separated by at least 750 nucleic acid residues in the target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel method for analysing a target nucleic acid sequence in, a biological material. The method comprises adding at least two nucleic acid primers that hybridise under stringent conditions to predetermined nucleic acid sequences of the target nucleic acid sequences of the target nucleic acid sequence by PCR, and detecting and sequence that are separated by at least 750 nucleic acid residues, amplifying the target nucleic acid sequence by PCR, and detecting and quantifying the target nucleic acid sequence. The methods and compositions of the present invention are useful for analysing a target nucleic acid sequence in a biological material by real time PCR using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nucleic acid primers that are separated by at least 750 nucleic acid residues in the target sequence. This polynucleotide sequence represents the genomic DNA of a West Nile virus used in the target analysis method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gillmeister L, Marlowe K, Armistead D;

Determining level of potentially active biological pathogens in biological meterial, by adding nucleic acid primer pairs to biological material, amplifying target nucleic acid by PCR, detecting and quantifying target nucleic acid.

Disclosure; SEQ ID NO 5; 111pp; English.

The Invention relates to a mentiod of determining [w]) levels of determining [w]) levels of adding at least two nucleic acid sequences by PCR, and detecting and adding at least two nucleic acid sequences, where quantity of the nucleic acid sequences, where quantity of the nucleic acid sequences, where quantity to of the nucleic acid sequences is proportional to number of biological pathogens in a biological material such as cells, is not carried and the properties, cartilage, corneas, atteries, veins, organs, tissue, blood or blood components, proteins, attacks, which camples, mummifical material, human or animal remains, atem cells, islet camples, mummifical material, human or animal remains, atem cells, islet camples, mummifical material, human or animal remains, atem cells, islet blood cells or platelets. The biological pathogen is chosen from happerglilus, calls pathogen is chosen from happerglilus, calls pathogen is chosen from happerglilus, calls and single cell parasites. The biological pathogen is chosen from happerglilus, candida, wilstopharia, bacteria, virusely, bendonman, Staphylococcus, Escherichim, Salmonella, Carmylobacter, Hallobacter, Listeria, Clostridium, Streptococcus, Energococcus, Staphylococcus, Furcella, Haemophilus, Salmonella, Carmylobacter, Hallobacter, Listeria, consociated virus (HWV), Happerlis of virus (HWF), Happerlis of virus, Parainfluence of all formic ancephalitis virus, where the plate of a biological pathogen is inactive or active. (MI) is useful for determining the effectiveness of a terrilization of the effective biological pathogen is inactive or active. to a West Nile virus DNA detected by the method of the invention. The invention relates to a method of determining (M1) level of

The present sequence represents the genome of a strain of West Nile virus (WNV), designated IS-98-STI. This strain is a neuroinvasive and neurovirulent strain of WNV. Polymucleotides and polypeptides derived from the IS-98-STI genome are useful for diagnosis and prognosis of Flavivirus infection, specifically WNV-mediated encephalitis. They are also useful to raise specific antibodies, for recombinant expression of WNV proteins or peptides (for diagnosis, production of antibodies and identification of specific binding partners in cells), for identifying cellular genes implicated in resistance to viral infection, and for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a diagnostic kit comprising at least one isolated and purified polypeptide comprising a west Nile Virus (WNV) envelope (E) protein or its immunogenic fragment having a native conformation or non-denatured structure and that is reactive with antibodies against WNV and cross-reactive with antibodies against a flavivirus. The diagnostic kit is useful in diagnosing flavivirus infection caused by DERVV, WNV, JEV or SLEV. This sequence corresponds the complete nucleotide sequence of the WNV isolate 2741.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 10975 BP; 3007 A; 2460 C; 3149 G; 2359 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleotide sequence of the genome of West Nile virus IS-98-ST1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 18; DB 12; Length 10975; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ဌ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecule that modulates replication of West Nile Virus
                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a diagnostic kit comprising at least one isolated and purified polypeptide comprising a West Nile Virus (WNV) envelope (E) protein or its immunogenic fragment having a native conformation or non-denatured structure and that is reactive with antibodies against WNV and cross-reactive with antibodies against a flavivirus. The diagnostic kit is useful in diagnosing flavivirus flavier by DENV, WNV, JEV or SLEV. This sequence corresponds the complete nucleotide sequence of the WNV isolate 3356.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; lifertion; layer failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method for identifying compounds (I) that can stimulate a gene of the OAS (2'-5'-oligoadenylate synthase) a method comprises: (a) inducing expression of the OAS gene in a culture of cells from a non-human mammal (Flvr/Flvr or Flvr/Flvs; indicating resistance or sensitivity to Flavivirus infection); (b) treating cells with test compound; and (c) measuring activity of OAS gene relative to a control. (I) are potentially useful as antiviral agents for treating infections by Flaviviruses (e.g. hepatitis C; dengue; yellow fever and various forms of encephalitis). Genomic OAS DNA and derived contains, also the encoded proteins, are useful: (a) for treating Flavivirus infection; (b) in screening for anti-flavivirus agents, and (c) for evaluating sensitivity of subjects to Flavivirus agents, and (c) for evaluating sensitivity of subjects to Flavivirus infection and their contains and developing severe forms of such infections. The present sequence is weet Nile Virus strain NY99-flamingo 382-99 (IS-98-STI) complete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                    Identifying stimulators of oligoadenylate synthase family genes, useful as antiviral agents against Flavivirus, also mutated genes responsible for sensitivity to virus.

of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to MNV infection e.g. pancreatitis, encephalitis, meningitis, meningitis, neurologic infection, hepatitis, understanding or circhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of molecule is selected from the group of ribozymes consisting of least ten 2'-O-methyl modifications, phosphorochioate linkages on at least ten 2'-O-methyl modifications, phosphorochioate linkages on at least tree of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic molety. Nucleic acid molecules SEQ ID No 1 to 37080 are claimed; however, SEQ ID No 2194-2206 and 17502-17514 are not given molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                         invention relates to nucleic acid molecules that modulate replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
(WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, the least ten 2'-0-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nuclecides and a 3' end modification of a 3'-3' inverted abasic molety. Nucleic acid molecules EEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, enmingitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-0-methyl modifications, phosphorothioate linkages on at

least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    늉
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New hybridization assay probe comprising target-complementary sequence bases, useful in detecting flavivirus, e.g. West Nile virus.

```
New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       hybridisation assay probe; nucleic acid detection; target-complementary sequence; flavivirus; West Nile virus; WNV; NAV virus; infection; meningitis; encephalitis; high throughput screening; probe; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                            New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ay allow for accurate and efficient high throughput screening. sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in flavivus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The present invention relates to a method for screening for a flavivirus in a subject or animal host. The method comprises: contacting a sample from the subject with a composition comprising a flavivirus envelope protein domain III polypeptide (ADK13683-ADK13701) under conditions that permit formation of specific immunocomplex between an antibody in the sample and the envelope protein domain III polypeptide; and detecting whether a specific immunocomplex is formed. The present sequence is the coding sequence for West Nile Virus protein, from which B protein envelope protein domain III polypeptide (ADK13683) is derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Diagnosing flavivirus infection by contacting a sample from a human or animal with a flavivirus envelope protein domain III polypeptide, and detecting formation of a immunocomplex between the envelope protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                            The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WWV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, waycarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least the Z-O-methyl modifications, phosphorothicate linkages on at least three of the 5 terminal nucleotides and a 3' end modification of 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                         New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, niver failure, hepatocallular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least tive ribose residues, a least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic molety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to nucleic acid molecules that modulate replication
                                                                                                                                                                                                                                                                                             New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; infection; hepatitis; liver failure; cancer; dirrhoais; Hammerhead; Inozyme; DNAzyme;

```
The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for Encating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DMAZyme, Amberzyme, and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least there of the S'terminal nucleotides and a's end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New mycobacterial peptide, its fragment, variant or derivative, useful as
                                                                                                                       New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growth or vlability of an organism. Polynucleotide sequences ABH51947 - AAH52092 represent DNA encoding proteins ABM51096 - AAG81294 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The
                                                                                                        encoded by ABZ71062 to ABZ71130 (II), which are isolated from Mycobacterium tuberculosis. (I) are encoded by genes (II) whose expression is induced or up-regulated during culture of a mycobacterium tuberculosis. (I) are encoded by genes (II) whose air seturation actioned by a dissolved oxygen tension of at least 10% air seturation measured at 37 plus degrees Celsius, when compared with a plus degrees Celsius. (I) and (II) have antibacterial, tuberculostatic and immunostimulant activities, and can be used in vaccines and gene therapy. (I) and (II) can be used for the manufacture of a medicament for treating or preventing a mycobacterial infection. They can also be used for the manufacture of a diagnostic reagent for identifying a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA aequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                           or pe
     method involves providing an unknown nucleotide or polypeptide sequences
                    and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may useful as a target for a drug or essential for the growth or viability an organism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

The invention relates to a method of producing West Nile viruses (WNVs)

CC by infecting a cell (preferably a human cell) which expresses an

CC adenovirus ElA protein with West Nile virus, or by tranforming the cell

CC with the West Nile virus genome. The invention also relates to a West

Nile virus produced by the method of the invention, vaccine compositions

CC containing such viruses, or containing a whole-inactivated lineage II

West Nile virus; and human cells, named PER.CC cells and deposited under

CC CACC number 96022940, having at least an adenovirus ElA gene integrated

into its genome and which comprises a nucleic acid coding for a West Nile

virus. The method and cells of the invention produce high titres of West

CC Virus. Such viruses can be used in vaccines for the prophylaxis,

Nile virus. Such viruses can be used in vaccines for the prophylaxis,

CC therapy and/or diagnosis of West Nile disease. These vaccines are also

CC useful for cross-vaccination against viruses that are highly similar to

CC West Nile virus. Sequences AD021519-AD021520 represent reverse

CC samples from infected human cells.
                                                                                                                            Producing West Nile virus useful as vaccine against West Nile virus infection, involves infecting cell, or culture of cell with West Nile virus and culturing cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Thale cress cDNA repressed in E2Fa/Dpa expressing plants SeqID 1529.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          30-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               23-JUN-1999
  This invention relates to a novel method for altering one or more plant characteristics. Specifically, it refers to identifying genes that are up characteristics. Specifically, it refers to identifying genes that are up comm.regulated in transgenic plants overexpressing the heterodimeric EZPa/DPa transcription factor of Arabidopsis and using these sequences to alter plant characteristics accordingly. The present invention describes compared to the plants for the production of growth regulators, contymes, therapeutics, pharmaceuticals and animal feed products, where the altered plant characteristics are selected from increased yield or biomass, enhanced survival capacity, stress tolerance, plant architecture or physiology, altered endoreduplication, biochemistry, signal cransduction, storage lipid mobilisation and/or altered photosynthesis, cach relative to the corresponding wild type plants. Accordingly, these sequences can also be useful as positive or negative selectable markers of during transformation of cells or tissues. The identified genes play a cole in a variety of biological processes such as DNA replication, cell or relative the factors. This polymucleotide sequence is thale cress cDNA cepressed 1.3 fold or more in plants overexpressing the EZFa/DPa
              9
         Altering plant characteristics, useful for producing plants for enzyme opharmaceutical production comprises modifying in a plant, expression of one or more nucleic acids and/or modifying level or activity of one or

New isolated cancer associated nucleic acids comprising at least 10 contiguous nucleotides, useful for diagnosing, preventing and/or treating cancers such as leukemia and lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to cancer associated sequences (ADQ97025-ADQ98004). The sequences are useful for the diagnosis, prevention and/or treatment of cancer, such as leukemia and lymphoma. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formate directly from WIPO at

associated (CA) mucleic acids encoding them. The invention also relates to a method for treating cancers involving administering to a patient an inhibitor of CAP, and a method of screening for anticancer activity in a potential drug involving providing a cell that expresses a CA gene, contacting a tissue sample derived from a cancer cell with an anticancer drug candidate and monitoring the effect of the anticancer drug candidate on expression of the CA gene. The appropriate of a cancer associated with expression of a CAP protein in a test cell sample cancer, involving determining the activity of a CAP protein. The CA mucleic acids are useful for diagnosing cancer, involving determining the expression of a CA mucleic acid in a cativity of a CAP protein. The CA mucleic acid is a cancer, involving determining the expression of a CA mucleic acid in a cancer, involving determining the expression of a CA mucleic acid in a cancer, involving determining the did not form part of the printed cancer the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at Etp. wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to cancer-associated proteins (CAP) and the cancer-

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (MVV). The nucleic acid molecules are useful for treating a condition related to MVV infection e.g. pancreatitis, encephalitis, mentalitis, mentalitis, mentalitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least the 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nuclectides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                      New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis.

encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, notecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least then 2-0-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 in the specification. The present sequence is that of a nucleic acid molecule of the invention
New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 17 BP; 3 A; 7 C; 5 G; 0 T; 2 U; 0 Other;

New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

```
ö
                               The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encaphalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyam, and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1 to 37080 are claimed; however, SEQ ID No 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of geneeic variation or in hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

ö nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence. The array of nucleic acid blot hybridisation in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence.html Gaps Steroid 22-alpha hydroxylase; transgenic; plant; sterol biosynthesis; ö 83.3%; Score 15; DB 9; Length 25; 100.0%; Pred. encoding a polypeptide having C-8.7 sterol isomerase activity. The polymucleotide is useful for transforming a cell and producing a transgenic plant. The polymucleotide is useful in the production of altered levels of sterol biosynthetic enzyme in a transformed host cell. Nucleic acid fragments of the polymucleotide are useful to create transgenic plants in which sterol biosynthetic enzymes are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found. The nucleic acid fragments are also useful as probes for genetically and physically mapping the genes that they are a portion of and as markers for traits linked to those genes. Such information is useful in plant breeding to develop in service with desired phenotypes. The nucleic acid fragments are also useful as restriction fragment length polymorphism (FRLP) markers, for physical mapping and in direct fluorescence in situ hybridisation (FISH) mapping. Novel isolated polynucleotide encoding a polypeptide comprising C-8,7 sterol isomerase activity, useful in the production of a transformed host cell and in the production of a transgenic plant. The invention relates to an isolated polynuclectide comprising a sequence encoding a polypeptide having C-8,7 sterol isomerase activity. The polynuclectide is useful for transforming a cell and production a transformed blank. The polynuclectide is useful in the production of a transgenic plant. The polynuclectide is useful in the production of altered levels of sterol biosynthetic enzyme in a transformed host cell. Worleic acid fragments of the polynuclectide are useful to create transgenic plants in which sterol biosynthetic enzymes are present at chigher or lower levels than normal or in cell types or developmental stages in which they are not normally found. The nucleic acid fragments are also useful as probes for genetically and physically mapping the genes that they are a portion of and as markers for traits linked to those genes. Such information is useful in plant breeding to develop lines with desired phenotypes. The nucleic acid fragments are also useful as restriction fragment length polymorphism (FRLP) markers, for physical mapping and in direct fluorescence in situ hybridisation (FISH) mapping. The present sequence represents CDNA encoding a plant steroid 22-alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated polynucleotide encoding a polypeptide comprising C-8,7 sterol isomerase activity, useful in the production of a transformed host cell and in the production of a transgenic plant.

This invention describes novel polynuclectides that encode protein

markers and fine chemical-production proteins from Corynebacterium

glutamicum. The polynucleotides are isolated from a nucleic acid library

of C. glutamicum then mutated at the specified positions, cloned and

expressed by standard methods. Cells, especially Corynebacterium

cexpressed by standard methods. Cells, especially Corynebacterium

cexpressed by standard methods. Cells, preferably amino acids and specifically

corynebacterium of fine chemicals, preferably amino acids and specifically

lysine, but more generally nucleotides, untamins, co-factors and

corporation of fine chemicals, vitamins, co-factors and

pharmaceutical industries. The polynucleotides, optionally as primers

corporates, can also be used for identification and classification of C.

glutamicum and related species, e.g. for diagnosis, for genomic mapping,

functional or evolutionary studies, gene manipulation and modulation of

corporativity and/or more efficiently. NoTE: This sequence is not

corporativity and/or more efficiently. NoTE: This sequence is not

corporativity and/or more efficiently. NoTE: This sequence is not

corporativity and/or more efficiently. NoTE: This sequence is not

corporation the printed specification but is available in electronic

format. The sequence represented in this record has been obtained from

WOZ003046123.
                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid encoding variant forms of marker and fine chemical-production proteins, useful for production of fine chemicals, specifically lysine, in microorganisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Drosophila, developmental biology, cell signalling, insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides a number of nucleotide and protein are quences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium acceptante is a monologue of a gene derived from coryneform bacterium. Secharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the examplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  fine chemical production; lysine production; nucleotide; nucleoside;

                                                                                                                                                                                                                 ...
                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABL01840-ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly

sequences from the Corposition bacterium Corposaterium guitamicum. These are useful for identifying the mutation point of a gene derived from a mutant of corposition bacterium masuring expression amount and analysing the expression profile or expression pattern of a gene derived from Corposition profile or expression pattern of a gene derived from corposition bacterium, and identifying a homologue of a gene derived from corposition bacterium. Corposition bacterium and accertains are useful for producing amino acids, nucleic acids, vitamine, saccharides and organic acids, vitamines, saccharides and organic acids, in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel biochip comprising probe spots, each containing many identical probes. The probes are nucleotide sequences of 30-80 bases, are prepared ex situ from synthetic oligonucleotides and at least one includes a segment of at least 20 bases identical with, or complementary to, a segment of an open reading frame (orf) of Escherichia coll K12. The blochip is used for specific detection of gene expression in K12 and for determining the gene expression pattern, e.g. for and in K12 and for determination of which E. coll strains are present in the gut, and to determine the effects of e.g. growth media on gene expression. The blochip provides as comprehensive as possible detection of the K12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Biochip containing probes complementary with open reading frames in Escherichia coli K12, useful for detecting gene expression and expression
mutation point of a gene, measuring expression of a gene, analyzing expression profile or pattern of a gene and identifying homologous gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 349980 BP; 80289 A; 91081 C; 97378 G; 81232 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

This invention describes a novel biochip comprising probe spots, each containing many identical probes. The probes are nucleotide sequences of 10-80 bases, are prepared ex situ from synthetic Oligonucleotides and at least one includes a segment of at least 20 bases identical with, or complementary to, a segment of an open reading frame (orf) of Escherichia complementary to, a segment of an open reading frame (orf) of Escherichia (in K12 and for determining the gene expression pattern, e.g. for diagnostic determination of which E. coli strains are present in the gut, and to determine the effects of e.g. growth media on gene expression. The biochip provides as comprehensive as possible detection of the K12 and to determine the effects of e.g. growth media on gene expression. The genome, with simultaneous analysis of many different genes with a single device, and comparison of gene expression between K12 and its mutants or other E. coli strains in a single experiment. Apart from qualitative and quantitative information about gene expression, it also allows measurements of population densities for the various strains. The use of synthetic oligonucleotides for preparation of probes allows free

genome, with simultaneous analysis of many different genes with a single device, and comparison of gene expression between K12 and its mutants or other E. coli strains in a single experiment. Apart from qualitative and quantitative information about gene expression, it also allows measurements of population densities for the various strains. The use of synthetic oligonuclectides for preparation of probes allows free synthetic oligonuclectides for preparation of probes allows free variation in probe length and ensures high purity (and thus selectivity, reactivity and reproducibility); allowed synthetic probes are generally shorter than probes prepared by polymerase chain reaction. ö
variation in probe length and ensures high purity (and thus selectivity, reactivity, and reproducibility); also synthetic probes are generally shorter than probes prepared by polymerase chain reaction. ACD68731 to ACD81540 represent oligonucleotide probes used with the biochip described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           used to demonstrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     systems including mass spectrometric methods for the analysis of sequence variations including mucleic acid polymorphisms and mutations. The fragmentation-based methods and systems of the invention are useful fragmentation-based methods and systems of the invention are useful for analysis of sequence variations including nucleic acid polymorphisms and mutations. The methods are useful for identifying a genetic disease or confirm including obseity, identifying a predisposition to a disease or condition including obseity, atherosclerosis, or cancer; identifying an infections agent; providing information relating to identity, heredity, or histocompatibility; identifying pathogens; or determining haplotypes. The fragmentation-based methods and systems of the invention are useful for the analysis of sequence variations including nucleic acid polymorphisms and mutations. The methods are useful for identifying a genetic disease or chromosome abnormality; identifying a predisposition to a disease or condition including obesity, atherosclerosis, or cancer; identifying an infection by an infections agent, providing including to infection agent, providing including to identify, heredity, or histocompatbhility; identifying pathogens; or determining haplotypes. AbQ16353-AbQ16361 represent Bordetella variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             16S rRNA gene regions. Amplicons from this regionwere used to demonstrate the invention. They were used to demonstrate a method for bacterial typing by base-specific fragmentation.

Library of polynucleotides for diagnosing a cancerous state of a mammalian cell and detecting cancer, particularly of the colon or prostate, comprises 3351 human polynucleotide sequences.

WPI; 2001-091805/10.

Claim 9; Page 626; 1046pp; English.

```
ö
The present sequence is one of 3351 sequences in a library of human polymucleotides. The library is used to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polymucleotides. The probes can be used for chromosome mapping of the polymucleotide and for detection of transcription levels. Ribozymes or antisense oligomucleotides can be generated. The polymucleotides and their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and presentive interventions. The polymucleotides, polypeptides and antibodies against them can be used in pharmaccutical compositions to treat the cancers and proliferative disorders such as neoplasia,

Oligo-dr track not found, Not I site shown in beginning of sequence is likely internal to the message. cDNA Library Preparation: M.B. Soares Lab Clone distribution: Researchers may obtain BNAP cDNA clones from RESEARCH GENETICS. It should be noted that Bento Soares is generating a small number of additional specialized non-redundant arrays of BNAP cDNAs whose availability will be considered under appropriate and limited collaborative arrangements The tissue for this library was contributed by Dr. Xin-Yuan Fu, Seg primer: M13 Forward

polylinker; Site_1: Not 1; Site_2: Eco RI; The
NIH BMAP Ret4 $2 library is a subtracted library,
ultimately derived from mouse retina tissue libraries at
various stages of development. For a detailed description
of the library from which this clone was derived, please
visit our web site at brainest:eng.ulowa.edu. The tissue
for this library was contributed by Dr. Xin-Yuan Fu, Yale

/notes "Vector: pSPORTI (Invitrogen); Site 1: Sall; Site 2: Not1; Mouse CDNA project by the Laboratory of Genetics, National Institute on Aging (NIA). Intramural Research Program, NIH (http://lgsun.grc.nia.nih.gov/cDNA). This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 1553-1558 (2001). [PMID: 11544199]). Total RNAs were obtained from Dr. Janet Rossant and Tilo Kunath (Samuel Lunenfeld Research Institute, Canada). Double-stranded combas were synthesized with an Oligo(dT) primer
